## Paint my apple watch

Got a new Apple Watch? Congrats! It's fun and useful, but you can't just take it out of the box, put it on your wrist and start using it. You must first set it up. This article provides step-by-step instructions on how to set up the new Apple Watch, as well as tips on how to use it and fix common problems. Let's start! The Apple Watch setting consists of two parts (we will cover both parts): the watch pairing with the iPhone and 1) Its use as a new watch or 2) data recovery from the previous Apple Watch. VCG/Stringer/Getty Images News Before you start developing the Apple Watch, you need: While the Apple Watch can do many things of its own, it gets a lot of its functionality from being connected to an iPhone in a process called tying. To accept these requirements, follow these steps to set up the Apple Watch and pair it with your iPhone. Turn on the Apple Watch by pressing and holding the side button on the watch until the Apple logo appears. When the logo appears, release the button. Move the iPhone and Apple Watch close to each other. Since the Apple Watch pairing with the iPhone uses Bluetooth, devices must be side by side for the connection to work. On your iPhone, open the Apple Watch app and tap Start pairing. Almost all of the instructions in the rest of this article refer to the steps you take in the iPhone Watch app. When the iPhone and Apple Watch detect each other, a rotating animation is displayed on the Apple Watch screen, a frame is displayed on the iPhone screen. Move the iPhone so that the Apple Watch appears in the iPhone frame. When your iPhone locks the clock, you'll automatically go to the next step. In some rare cases, the iPhone and Apple Watch may not be able to connect in this step. If you're having this problem, tap iPhone to manually link your Apple Watch and follow the on-screen prompt to pair your devices. After pairing your iPhone and Apple Watch, you can choose Restore from Backup or Set as a New Apple Watch. If you previously had an Apple Watch and want to use that data, select Restore. Otherwise, select Set as New. Navigate to one of the other two sections of this article based on your choice in the last step. If you haven't had an Apple Watch before or you don't want to restore from a backup, this is an option. Here's what to do: To use this option, you must follow the steps from the first section of this article. When you choose to set a new clock, there's not much to do on the first few screens. Accept apple's terms, wait for the Watch app to sign in to your Apple ID account (if you're prompted to sign in, do it), and then tap OK on the Shared Settings screen. If you purchased a used Apple Watch, you may be prompted to log in to your Apple ID. In this case, the watch may still be associated with the seller's Apple ID. If so, you will not be able to continue until the activation lock has been removed. Learn about how to unlock unlock iPhone (tips apply to apple watch). You can then create a passcode to protect your Apple Watch. It's like your iPhone's secret code. To use the basic 4-digit code, tap Create passcode and enter your preferred code twice on your Apple Watch. To use more complex and secure code, tap Add long passcode and enter the code on your watch. You can also choose Don't add a passcode, but we recommend that you pre-do it. The iPhone Watch app then lets you learn about the apple watch's heart health features for models that support them. There is nothing other than a click continue on this screen. All cardiac health features are used only on the clock, after being prescribed. The Apple Watch supports Apple Pay for easy and secure wireless payments. If you're already using Apple Pay on your iPhone, you just need to re-authorize your card. If you're not using it yet, you can set it up in this step. Select Continue to set up Apple Pay, or Set up later in the Apple Watch App. The next screen explains the security features of the Apple Watch (exact options vary by model, but they include emergency SOS calls and crash detection). To turn on fall detection, go to the iPhone Watch app, then select My Watch &t Emergency SOS &t; Move fall detection to on/green. The clock inherits many settings from the iPhone. If you've already set up things like emergency contacts and health and activity goals, these settings will be automatically added to your watch. If not, you may be prompted to set them up here. If your Apple Watch supports cellular connectivity, you can currently configure a mobile service. Tap Set up a mobile connection. This gives you the process of setting up a phone company to provide mobile services to your watch. Follow the on-screen instructions until you return to the screen that says your mobile connection is ready. Tap Continue. You can install Apple Watch apps that give iPhone applications mini versions directly on your wrist. On this screen, you can choose to install all the apps available on your iPhone, All Watch or Choose later. If you want to start using the clock right away, it's probably better to do it later. Installing apps on the clock can be slow and if you choose to install all available programs, it can be quite a long time before the clock is ready. If all settings are selected, the iPhone and Apple Watch will start syncing. How long it will take depends on how much content you sync, but expect it to take at least a few minutes. Check the progress wheel in both the iPhone and the Watch state. The noise will play out so you know when the process is over. While you're waiting, you can learn more about the clock by swiping up on its screen and tapping tutorials. When the sound and vibration notify you that the synchronization is complete, press Watch's Digital to start using it. If you previously had an Apple Watch and want to transfer data from that watch to a new model, this is an option for you. Just follow these steps. You are before you begin these instructions, follow the steps in the first section of this article. First, choose which backup you want to restore in the new Apple Watch, the iPhone App Watch will show you all possible backups. Just tap the one you want. The first few screens when you select a backup are pretty fast. I agree with Apple's terms, sign in to your Apple ID (this should happen automatically, but sign in if you are asked). To continue, on the Shared settings screen, tap OK. Then create a passcode. Tap Create passcode to use a simple 4-digit code to protect your watch. Enter the code you want twice on the clock. Tap Add a long passcode to use more complex code, or tap Don't add an access code to make it completely missed (but it's not a good security habit and we don't recommend it). If your Apple Watch supports Heart Health features, the next screen will provide detailed information about them. There's nothing to do except read about features, then tap Continue. If you want, you can add Apple Pay to the watch. Tap Continue to set up Apple Pay, or Set up later in the Apple Watch App to do so later. Currently, the iPhone and the Apple Watch are starting to sync. It will take anywhere a minute or two or much longer, depending on how much data is synchronized. The wheel shows progress on both the iPhone and the Watch. Noise plays and the clock vibrates to know that the synchronization is complete and that you can start using the clock. Just press Digital Crown. Hero Images/Getty Images Now that your Apple Watch is set, it's time to start learning how to use it. Of course, there is a lot to learn, but we have some useful content for beginners and experienced users, which we recommend to check: image copyright Apple Inc. Sometimes the Apple Watch makes a mistake, and when they do, you need to know how to fix them. Review this set of troubleshooting articles. Restart the Apple Watch. As with the iPhone, sometimes problems can be solved by simply restarting the clock. Learn how to restart your Apple Watch. Find the lost Apple Watch. The same technology used to Find My iPhone also helps to find a lost or stolen Apple Watch. Learn how to find your Apple Watch. Apple Watch won't turn on? If the Apple Watch just doesn't turn on, you need tips on how to fix the Apple Watch, which won't turn on, Apple Watch and iPhone unseeding. If you upgrade to a new Watch model, or you'll need to follow some advanced troubleshooting steps, you might need to unlink your Watch and iPhone. Learn how to unlink your Apple Watch and iPhone. Thank you for informing us! Tell me why! Apple Watch Series 3 offersApple Watch 3 (or Apple Watch Series 3 if you're in particular) have been changed several times, recently replaced The Watch 6 and apple watch SE, the latter of which can be a real competitor, because they are both budget models. But watch 3 stays for sale - this is more than we can say to watch 4 or even the Apple Watch 5 -- and now it's also been heavily discounted. Clock 3 is available in two forms -- one with cellular communication, and one only gps. As a replacement for the Apple Watch 2, this device was a fitness and durability flag, with a running and cycle tracking on board, and a swimming-resistant water body and the same heart rate monitor at the bottom. And while the newer models pack includes additional features and faster chipsets, Apple has consistently supported apple watch 3 software updates, most recently watchOS 7, which adds sleep tracking, new workouts and much more. It may also get even cheaper during bargaining seasons such as the upcoming Black Friday and Cyber Monday. In fact, we expect to see many Apple Watch Black Friday deals this year. Although it also now has more competition, as mentioned above, so is it still worth your money? Update: Apple has started installing watchOS 7, and the Apple Watch 3 is one of the models that can get it. In addition, the company also introduced the Apple Watch 6 and Apple Watch SE. Launched on September 22, 2017, still on sale from ApplePrice starting at £199/\$199/AU\$319LTE, the version starts at £299/\$299/AU\$469At launch at the end of 2017, the Apple Watch 3 was the most expensive laptop the company sold, but now the price has dropped since the launch of the Apple Watch Series 4 and Apple Watch 5. It is still not basically a cheap smartwatch, but now it is much more affordable. There are two Apple Watch 3 variants: one with LTE/cellular capabilities and one with only GPS onboard. Former costs £299/\$299/AU\$469/AED 1,199 or £329/\$329/AU\$519/AED 1,329 (38mm and 42mm bands respectively) these days due to serious discounts after the release of the Apple Watch 5.The 3 series GPS version is much cheaper at £199/\$199/AU\$319 for 38mm and £229/\$229/AU\$369 for 42mm. It's also worth noting that while Apple has discontinued the Apple Watch 4 and 5, you can still get the Apple Watch 3 directly from the company, making it easy to hold back. The Apple Watch 3 (top) and 2 (bottom) design is almost identical to Do we need LTE? Connecting pretty well, there may be a touch patchyExtra price to broadcast your data from WatchThe biggest update the Apple Watch 3 has brought was inside your mobile phone so it can work regardless of your phone. Does this mean you can buy one without owning an iPhone? Unfortunately, not... not a long way off. In fact, this means that you can receive phone calls and some app notifications when your phone is at home, but otherwise it depends entirely on your phone. As for the notifications, if the program you want to use hasn't been updated to run in standalone mode (as is, you don't need a dial-up connection), then you won't receive updates and notifications even if LTE connection is enabled. The ability to connect to a mobile network is good, but does not feel like function add add - although some people have already reported that this has saved their lives. You can turn off LTE from control center Call quality from such a small device is really quite impressive -- running with someone we conducted a phone conversation, and both the voice quality from the speaker and the microphone sensitivity was excellent. This meant that we could run almost normally and still hold the conversation without having a Watch 3 in the head. In fact, it was so loud you needed a quick move to stop people from listening. It's less useful when driving - ambient noise complicates what they say - but it will make a pinch and save you from illegal phone grabbing. We doubt whether you really need functionality - not least because you have to pay extra for it. It's especially galling that you need to spend between \$5-\$10/£5/AED 25 per month to have your data -- that you already pay for -- pumped into your device. If the addition of data to the watch was free and simply naturally extended to the wrist, it would be good, but because of the extra cost it is difficult to recommend an LTE version for this reason.50 million songs on the wristOne next update is an addition to music streaming, something that was announced at the time of launch of the Apple Watch 3, but curiously was not present at the time of launch. This feature - if you paid all the money to have a Watch 3 OPTION LTE and pay extra money each month to have data - is actually a pretty good addition. With apple music's new streaming capabilities, you'll get two things: live apple music and Beats Radio. They are both available simply via Siri - you can tap through the clock to get there, but it's very picky. The easiest way is to ask Siri to play the music you want on the go - whether it's by genre, a playlist that you've already created but doesn't sync, or just a certain song. It's not perfect -- especially when you're outside and walking or running -- but when it works it's a dream, futuristic scenario where you command almost any song in the world during a conversation with your wrist. As a music broadcast on the Apple Watch 3 made me listen to opera at the lakeYou really have to be included in the Apple Music system to make it work well -- for example, you can't browse playlists on your wrist and just ask Siri to play some running music driven by some strange choices. However, a playlist that has already been created can be accessed in a second. Well, we say in a second... too often Siri would have trouble connecting and telling us to stick... I'll tap you when I'm ready. And then don't join the age, forcing a repeat. The whole Apple Music streaming setup is great when it works, when you ask for music that you like, and it plays what you like. It's a little too glitchy sometimes to completely feel like you're constantly connected to so many songs -- and you usually have your phone with you which is far away way to access the songs, but it's a nice feature and one that will only improve. Despite apple music streaming capabilities, we still can't see a good reason to recommend the Apple Watch 3 LTE option because it's been taken care that your phone doesn't need to run by adding GPS to the watch with the second-generation model. Do we want another time when we are always connected? Isn't workout time off? And are you willing to pay a much higher price surcharge so you can listen to music or use apps away from your phone? With this in mind, you should only consider the Apple Watch 3 LTE option if you are worried that you will not be contacted when not using it, or leave your phone inexplicably in places. Design and displayOnly identical design for previous modelsScreen is still bright and brightSmaller screen than the Apple Watch 4Apple Watch design has become quite iconic, so that people just know that you are wearing an iTimepiece. When you see a footballer wearing a Fitbit, you'll need to communicate to see which model it is, but with the Apple Watch it's instant recognition. Unlike the iPhone, we don't see the need to update the design that much with the watch, and Apple has done quite well to keep the chassis almost identical, given that it is now packing a new chipset and cellular two-size device (38mm and 42mm). This is done by integrating the antenna into the screen, which is an innovative way to save space ... although the clock could not be any chunkier, such is its square, curved design. There has been a slight upgrade to the production process though, as clicking on the Digital Crown or power button feels more robust than the Apple Watch 2.This is subtle, but that's what we've noticed every time we use the Watch 3. In addition, the only major difference is the Digital Crown, which now sports a red dot to make it a new model. The screen is still clear and bright, as always It's nothing big, but we got a question about when wearing a watch, suggesting that people are interested when a new watch comes up. It's elegant and lightweight, and while some years of circular display, the 1.65-inch display (on the 42mm version) is certainly the optimal size and shape to display more data - and as mentioned, Apple has brutally forced to take its watch design to market. The screen itself, which uses OLED technology, has always been one of the most attractive on the market. It's clear bright and bright, and we've never had a problem with not being able to see when out and about. Well, it's not quite right - the screen turns off to save the battery if needed, which means you have to flick your wrist to see the screen. While this is far from ideal, Apple has adjusted the algorithm so that even a small flick shoots the screen - and while it's not always so accurate when running, for example, it's much, much better than we saw with the first version of the Apple Watch.Image Credit: TechRadar TechRadar
